Time-Saving Tips

- 1. Locate installation parts and tools behind the bottom-left display door. The provided splice wrench and torque stick are shown at right.
- **2.** Do as much preparatory work on the ground while displays are easily accessible.
 - Move mounting components to approximately where the structure's uprights are located. The display's center is clearly marked for easy measurement.

Splice

Channel

Wrench

Mountina

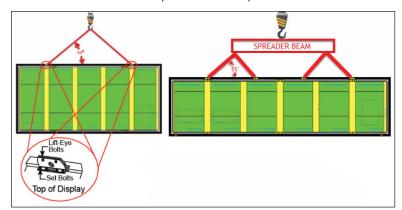

- Assemble the web camera to arm supplied with the display.
- Assemble webcam arm to the display.
- Evenly distribute splice plates.

Display Installation

- 1. Verify that the lift eyes are installed and the lift eye bolts and set bolts are in place.
- 2. Attach the crane to the lift-eyes in the top section.

- **a.** The angle on the lift eye straps must be greater than 55° from horizontal.
- **b.** For sections with more than two lift eyes, a spreader beam must be attached to each lift eye. Each lift eye must have its own strap.

3. Remove the shipping hardware from the top section.

- **4.** Loosen and slide the black alignment bracket up to guide the top section onto the bottom section.
- 5. Use a 7/16" wrench to remove the bolts that hold the lift eyes together and to the bottom section of the display. Slide the two pieces of the lift eye past each other and lift them out of the channel. Place the lift eyes in the spare parts location for future use.

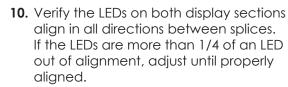

7. Lower the top section on to the bottom section.

Note: Do not move vertical splice tubes into place until after the top section is secured to the bottom section to avoid damage during assembly.

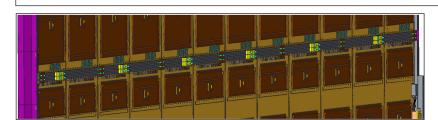

11. Distribute the flat splice plates evenly along the rear of the display.

Note: Ensure there is a flat splice plate near each end of the display.

12. Position bolts so they can slide easily into place once the plate is in position. Slide into channels to secure the top half to the bottom half.

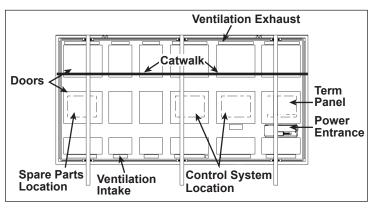

13. Use the provided torque stick, an 11/16" socket, and an impact wrench to loosen the bolts that hold the vertical splice tube in the bottom section. Consult the Shop Drawing for more information.

Note: The spare parts rack is located behind the left display door.

- **14.** Slide the vertical splice tube so it is split evenly between the display sections as shown. Tighten the hardware to 75-100 ft-lbs.
- 15. Repeat Steps 11-14 for all vertical splice tubes.

16. If needed, relocate the ISP enclosure to the alternate location to avoid structural interference when installed.

17. Slide the border splice plates and covers into place (when equipped). Attach with supplied Tek screws and nuts for sectional displays.

Optional

Offset Extrusion

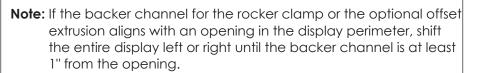

Upright Flange

Rocker

- 18. Connect the signal and power splice cables between the display sections. Refer to Electrical Installation (p.2) for more information.
- 19. Install the webcam and webcam arm.
- **20.** Connect the webcam cable and green grounding cable to the rear of the display.
- **21.** Remove the shipping braces from the bottom display section.
- 22. Lift the display to the structure.
- **23.** Lower the display until it rests on all the display ledger brackets. If needed, insert metal shims until the display is resting on all ledger brackets.

Important Notes:

- Make sure structure uprights are plumb and level with one another.
- Make sure there are no obstructions between mounts and structure.
- Make sure there are no obstructions on the display mounting surface of the I-beam.
- The display must rest completely and firmly on each ledger bracket.
- **24.** Slide all the rocker clamps over until they engage the upright flanges.
- **25.** Tighten all of the nuts on the rocker clamps or the offset extrusion bolts to 75 ft-lbs with an impact wrench and the provided torque stick.

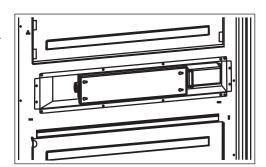

- **26.** Place and tighten all remaining mounting assemblies to 75 ft-lbs.
- 27. Remove the crane support.
- **28.** Locate the top border cover caps, when equipped, that are fixed to the border cover for shipping. Use supplied Tek screws that are taped to the cover for installation.

Electrical Installation

- Refer to the display riser diagram for site-required power.
- Run conduit from the main distribution panel (provided by customer) to the display power entrance(s).
- 3. Loosen the four screws that secure the power entrance cover and lift it off of the power entrance.

- **4.** Feed power cable through the conduit into the power entrance.
- 5. Connect the ground wire to the ground lug at the bottom of the power entrance box (green wire) and tighten to 45 in-lbs with a 3/16" hex head wrench.
- **6.** Connect power line 1 (L1) to Line 1 of the tap and use a 3/16" hex head wrench to tighten to 57 in-lbs.
- 7. Connect power line 2 (L2) to Line 2 of the tap and use a 3/16" hex head wrench to tighten to 57 in-lbs.
- **8.** Connect the neutral line to the neutral tap and use a 3/16" hex head wrench to tighten to 57 in-lbs.
- **9.** Verify the breaker for the Backlit ID is off.
- 10. Replace and secure the power entrance cover.
- 11. Locate the conduit sleeve in the bottom of the top section. Remove the cables from the conduit sleeve. Place the conduit sleeve in the holes between sections and run the signal cables through it to the bottom display section.

- **12.** Remove the cover from the bottom section term panel. Connect the power splice cable to the power interconnect jacks on each display section.
- 13. Replace the cover on the bottom section term panel.

Signal Splicing

- 1. Connect the signal splice cables from the display top section by passing them through the conduit sleeve.
 - **a.** Connect Signal A on the top section PLR to Signal B on the bottom section PLR.
 - **b.** Connect Signal B on the top section PLR to Signal B on the bottom section.
- 2. Refer to Interconnect drawing <u>DWG-4270493</u> for PLR fiber routing.
